WORK EXPERIENCE

QA Wolf — QA Lead

10/2025 – Present

- Own test strategy, delivery, and client reporting for Harvey, an \$11B AI legal platform, leading and maintaining a test suite of **1,600+ Playwright/TypeScript E2E tests** across 13 different product domains
- Built and maintain a Page Object Model framework of **82 page-object classes (~76K lines)** with a central PageFactory registry and compiler-enforced entry points; executed platform-wide POM codemod and environment migrations across the full suite
- Made failure evidence **self-serve for an AI agent**: platform run logs, traces and failure video pulled programmatically and live application state verified directly, so triage no longer waits on a human to fetch a screenshot
- Triage failures by root cause rather than one test at a time: a single call-graph census pinned a **suite-wide defect across 71 affected tests** in one pass, and a re-run-first policy proved a third of batch failures were infrastructure contention needing no code change
- Converted **~1,300 client spec cases** into a machine-readable source of truth and gate every test against its own spec steps before it ships, so coverage is verified rather than assumed

QA Wolf — QA Engineer

07/2025 – 10/2025

- Ranked **first on the team in delivery metrics** within three months of hire, earning promotion to QA Lead
- Automated Microsoft Office add-in testing across native PC and Word Web (**65 tests**) and validated non-deterministic LLM behavior throughout: agentic document workflows, streaming completions with multi-minute retry windows, citation integrity and knowledge-source attachment
- Extended coverage beyond the browser to iOS native app test via Appium, email and Twilio SMS/MFA, file upload/download, Excel export validation, and stealth-browser OAuth automation against anti-bot protections

Zeta Global — Software Developer

02/2023 – 07/2025

- Built internal React/Next.js dashboards with real-time PostgreSQL filtering that **saved 20+ hours/week** across teams, a Python scraping tool over REST and SQL that **improved data accuracy by 95%**, and the Git/GitHub Actions/Docker CI-CD pipelines that tested and deployed them

PROJECTS

The Control Room — human-in-the-loop AI automation

Personal project, 2026

kxvin1.github.io/control-room

- Cut a broken test from **ten manual hand-offs down to two**: an AI agent owns the repair, and four always-on screens surface only the steps that still need a person
- Designed evidence gates so the agent **cannot self-certify**: "ready" requires two clean local runs plus one infrastructure run recorded against the same commit, run id attached for audit
- Built in a **self-improvement loop**: the agent files its own bugs and improvements from its daily work, runs a nightly retro on its own mistakes, and converts each lesson into an automated check that must catch a planted failure before it is trusted
- Gave the agent **first-party access** to run logs, traces, failure video and the live application, so it diagnoses, fixes and verifies on its own rather than pausing for a human to gather evidence
- Nothing about it is specific to testing except one config file, so the same engine runs **any workflow where an AI does the work and a person owns the final call**: code review, AI evals, support triage, hiring
- Each screen answers exactly one question: what needs me now, where every test stands, what is running, and what got done

EDUCATION

App Academy 1000-hour full stack web development, 07/2022 · CSU Northridge B.S. Psychology, 12/2019
